

PRODUCT PROPOSAL

Exchange CRM Platform

A unified digital operating system for currency exchange businesses — rates, customers, transactions, verification and marketing in one platform.

What we are proposing. We will design, build and deliver the complete Exchange CRM Platform described in this document — the six core modules, the CRM and verification layer, the customer portal and the API-first foundation behind them — as one working product owned by the client, including development, testing, deployment and handover. The fee below is the agreed price for building that platform.

COMMERCIAL SUMMARY

TOTAL PROJECT PRICE

£2,500

BRITISH POUNDS (GBP)

DELIVERY TIMELINE

2 – 3 months

Any change to the agreed deadline is reviewed and confirmed with the client before it takes effect.

Application support. Ongoing support and maintenance of the application after delivery is charged separately and is not included in the project price — the support scope and its fee are agreed with the client.

CONTENTS

What This Document Covers

01	Executive Summary	The business problem and the solution
02	Project Overview	Scope, users and operating model
03	Core Features & Modules	Six functional pillars of the platform
04	Advanced CRM Capabilities	Customers, KYC, notifications, analytics, roles
05	Platform Architecture Vision	API-first, integration-ready design
06	Business Benefits	Operational and commercial impact
07	Future Expansion	The roadmap beyond launch
08	Conclusion	Why this is a complete transformation

01 • Executive Summary

THE BUSINESS PROBLEM

Most exchange businesses still run on tools that were never designed for them. Rates live in a spreadsheet, customer requests arrive through messaging apps, banner graphics are made by hand for every price change, and banking details are re-typed from photographs. The result is predictable: slow response times, pricing that is out of date the moment it is published, avoidable transfer errors, and no reliable record of who did what.

As transaction volume grows, this model does not scale. Staff spend their day on repetitive administration instead of serving customers, and management has no consolidated view of performance, currency demand or customer value.

HOW THE PLATFORM SOLVES IT

The **Exchange CRM Platform** consolidates every daily operation into one connected system. A single rate table feeds the customer portal, the marketing designs, the public website widget and the API at the same moment. Customer requests arrive as structured records instead of free-text messages. Banking information is validated automatically before money moves. Every approval, status change and completed transaction is logged against a customer profile.

One source of truth, many destinations

Publish a rate once — it appears instantly in the customer portal, the Instagram banner, the Telegram post, the website widget and the public API. No duplicate entry, no version conflicts, no outdated prices in circulation.

VALUE FOR THE EXCHANGE BUSINESS

AREA	SHIFT DELIVERED BY THE PLATFORM
Rate publishing	Manual copy across channels → single update, synchronised everywhere
Customer requests	Chat messages and phone calls → structured, trackable workflow
Banking data	Typed by hand, error-prone → automatically detected and verified
Marketing content	External designer per price change → in-house, minutes, on-brand
Management visibility	Estimates and memory → live dashboards and reports
Accountability	Informal → role-based permissions and full audit history

THE PROPOSAL IN ONE PARAGRAPH

Build one platform that owns the exchange's rates, customers, requests, verification, marketing output and reporting — delivered as six core modules on an API-first foundation, so that the same system can later power mobile apps, bots and partner integrations without being rebuilt. The sections that follow describe each module, the CRM layer around it, the architecture behind it, and the business impact expected from it.

SECTION 02

Project Overview

The Exchange CRM Platform is a comprehensive customer relationship management system built specifically for exchange businesses. Its purpose is to centralise and automate daily operations — customer management, transaction processing, exchange rate management, marketing content creation and online customer services — inside one product.

Rather than adapting a generic CRM to an industry it was not designed for, the platform is organised around the way an exchange actually works: a rate is set, a customer requests a buy or sell, the request is reviewed and verified, funds move, and the outcome is recorded and reported. Every module in the system serves a step in that chain.

Who Uses the Platform

USER	WHAT THEY DO IN THE SYSTEM
Customers	Register, submit buy and sell requests, upload documents, track status and review history through the self-service portal.
Operators	Receive incoming requests, verify customer and banking information, process transactions and update status.
Exchange managers	Set and publish rates, approve high-value transactions, oversee the daily queue and monitor performance.
Marketing staff	Produce rate banners and promotional content for Instagram, Telegram and the website directly from live prices.
Accountants	Reconcile completed transactions and draw revenue, volume and currency-demand reports.
Administrators	Manage users, roles, permissions, integrations and platform configuration.

The Operating Cycle

The platform closes the loop between pricing, demand and fulfilment. Rates published to the market generate customer requests; requests are verified and processed; completed transactions feed the analytics that inform the next pricing decision.

Design Principles

- ◆ **Single source of truth** — one rate table drives every channel.
- ◆ **Structured over informal** — every request is a record, not a message.
- ◆ **Verify before value moves** — validation built into the workflow.
- ◆ **API-first** — every capability is available to other systems.
- ◆ **Role-aware** — staff see and do only what their role allows.
- ◆ **Built to extend** — mobile, bots and partners plug into the same core.

Module Map

The platform is delivered as six core modules, supported by the CRM capability layer described in Section 04. Each is detailed on the following pages.

#	MODULE	WHAT IT DELIVERS
01	Exchange Rate Management	One authoritative rate table for every currency and price type
02	Banner & Content Creator	In-house marketing graphics driven by live prices
03	Customer Portal	Self-service requests, tracking and history for customers
04	Banking Verification	Automatic validation of customer banking information
05	Transaction Management	End-to-end workflow from request to completion
06	Rate Web Service	Public API and widgets for websites and partners

SECTION 03

Core Features & Modules

Six functional pillars cover the full operational surface of an exchange business. Each module works independently and gains value from the others through shared data.

MODULE 01

Exchange Rate Management System

Purpose. Give the exchange one authoritative place to define, price and publish every currency it trades – with full control over how each price type is calculated and where it appears.

BUSINESS BENEFIT

Prices stay consistent across every channel and update in real time, removing the risk of trading against a stale rate and eliminating the daily work of re-publishing prices by hand.

KEY CAPABILITIES

- ◆ Multi-currency support – USD, EUR, GBP, TRY, USDT and more
- ◆ Separate buying and selling prices per currency
- ◆ Real-time price updates across all connected services
- ◆ Price types: cash, transfer, account-based and custom rules
- ◆ Centralised rate management for portal, banners, widgets and API
- ◆ Custom pricing rules for segments and special agreements

PRICE TYPES SUPPORTED

TYPE	TYPICAL USE
Cash	Over-the-counter physical currency exchange at the branch
Transfer	International or interbank transfers where settlement differs from cash
Account-based	Balance-to-balance movements for registered customers
Custom rules	VIP tiers, volume pricing and negotiated corporate rates

**MODULE 02****Digital Banner & Marketing Content Creator**

Purpose. Put a professional design studio inside the CRM. Staff build rate banners and promotional graphics with a drag-and-drop editor that works like modern design platforms — with live prices injected automatically.

BUSINESS BENEFIT

Marketing that used to take an external designer and half a day now takes minutes, stays on brand, and can never show an outdated price — because the numbers come from the live rate table.

KEY CAPABILITIES

- ◆ Drag & drop visual design editor
- ◆ Ready-to-use, reusable templates
- ◆ Dynamic price variables bound to live rates
- ◆ Automatic insertion of the latest exchange rates
- ◆ Publish or download directly from the platform
- ◆ Brand-consistent output across every channel

OUTPUT FORMATS**HOW IT WORKS**

MODULE 03

Customer Portal

Purpose. Give customers a professional self-service channel to submit and follow their exchange requests, replacing phone calls and chat threads with a clear, always-available interface.

BUSINESS BENEFIT

Requests arrive complete and structured, staff stop chasing missing details, and customers get transparency into their own transactions around the clock — raising service quality without adding headcount.

WHAT CUSTOMERS CAN DO

- ◆ Create and manage their profile
- ◆ Submit currency purchase and sale requests
- ◆ Track the live status of every request
- ◆ Review complete transaction history
- ◆ Manage personal and banking information
- ◆ Receive status updates without contacting staff

REQUEST FLOWS

REQUEST TYPE	INFORMATION CAPTURED
Currency purchase	Currency type · required amount · payment information · bank account details
Currency sale	Currency type · amount · receiving account information · required transaction details

CUSTOMER JOURNEY

MODULE 04

Banking Information Verification System

Purpose. Validate customer banking details automatically through available banking APIs and verification services, before any funds are committed.

BUSINESS BENEFIT

Transfers to wrong or mistyped accounts are among the most costly errors an exchange can make. Automatic verification removes that class of error, strengthens compliance posture, and shortens the time an operator spends checking each request.

KEY CAPABILITIES

- ◆ Detect bank information from card numbers
- ◆ Retrieve card and account details automatically
- ◆ Validate ownership information against the customer record
- ◆ Check the accuracy of customer-provided banking data
- ◆ Reduce human error during transaction processing
- ◆ Process transactions only on verified information

WHAT GETS CHECKED

DATA POINT	CHECK PERFORMED
Card number	Issuing bank identified automatically, removing manual lookup
Account details	Retrieved and cross-checked against the submitted request
Account holder	Ownership information validated against the customer profile
Overall accuracy	Mismatches flagged to the operator before the transaction proceeds

**MODULE 05****Transaction & Request Management**

Purpose. Provide a complete workflow engine for every customer request — from arrival to completion — with clear ownership, status and history at each stage.

BUSINESS BENEFIT

Nothing is lost, forgotten or handled twice. Management can see the live queue, measure how long each stage takes, and hold a complete audit trail of who approved what and when.

WHAT EXCHANGE STAFF CAN DO

- ◆ View and triage all incoming requests
- ◆ Review complete customer information in context
- ◆ Approve or reject transactions with reasons recorded
- ◆ Update transaction status as work progresses
- ◆ Track completed operations and outcomes
- ◆ Maintain a full history against each customer

TRANSACTION WORKFLOW**STATUS MODEL**

STATUS	MEANING	OWNER
New request	Submitted by the customer, awaiting pick-up	Operator queue
Review	Customer and banking information being checked	Operator
Approval	Decision recorded, with reason if rejected	Exchange manager
Processing	Funds being moved and settled	Operator / accountant
Completed	Closed, archived to the customer's history	System

**MODULE 06****Exchange Rate Web Service & Website Integration**

Purpose. Expose the exchange's live rates as a service, so they can be displayed on the company website, partner sites and any external application.

BUSINESS BENEFIT

The exchange publishes its rates everywhere its customers already are, without maintaining any of those surfaces by hand — and becomes a rate source that partners can build on.

KEY CAPABILITIES

- ◆ Public API for exchange rates
- ◆ Website-ready rate widgets
- ◆ Customisable display components
- ◆ Real-time synchronisation with the rate table
- ◆ Simple integration with existing websites
- ◆ Consistent publishing across digital channels

WAYS TO CONSUME THE SERVICE

METHOD	BEST SUITED TO
Embeddable widget	The exchange's own website — a styled rate board that updates itself
Custom components	Landing pages and campaigns needing a specific look or currency subset
Public API	Partner sites, mobile apps, bots and internal tools that need raw rate data

How the six modules compound

Each module is useful alone, but the value is in the connections: rates set in Module 01 populate the banners of Module 02, the portal of Module 03 and the public API of Module 06. Requests raised in the portal are verified by Module 04 and processed by Module 05 — and every step of that chain writes back to the same customer record.

SECTION 04

Advanced CRM Capabilities

Beyond the six operational modules, the platform provides the CRM layer that turns transactions into relationships — and operations into measurable performance.

CUSTOMER MANAGEMENT

Know every customer, not just every transaction

Complete customer profiles with full transaction history, segmentation, dedicated VIP management and activity tracking — so pricing, service level and outreach can be matched to real customer value.

KYC & IDENTITY VERIFICATION

Compliance as a workflow, not paperwork

Structured document collection, a guided identity verification workflow, clear verification status on every profile and controlled customer approval — keeping the business auditable and defensible.

NOTIFICATION SYSTEM

Customers informed automatically

Automated SMS, email and Telegram messages for transaction status updates, verification results and important announcements — cutting inbound "where is my request?" traffic to a fraction.

ANALYTICS & REPORTING

Decisions based on data

A professional dashboard covering customer statistics, transaction volume, revenue, currency demand analysis, daily and monthly performance, and operational analytics.

User Roles & Permission Management

The platform supports multiple internal users with different access levels. Each role carries a permission set matched to its responsibilities, so staff work with exactly the access their job requires — and no more.

ROLE	TYPICAL SCOPE OF ACCESS
Administrator	Full platform configuration, user and permission management, integrations
Exchange Manager	Rate setting and publishing, transaction approval, oversight of the operational queue
Operator	Request processing, customer verification, status updates
Accountant	Financial records, reconciliation, revenue and volume reporting
Sales Staff	Customer profiles, follow-up, segmentation and relationship activity

Why role separation matters commercially

Clear permission boundaries reduce internal risk, make responsibility traceable during audits or disputes, and let the business grow its team without loosening control over pricing and approvals.

Capability to Outcome

CAPABILITY	WHAT THE BUSINESS GETS FROM IT
Customer management	Pricing, service level and outreach matched to actual customer value instead of guesswork
KYC & verification	A defensible compliance record, produced as a by-product of normal work
Notifications	Fewer inbound status enquiries and a customer experience that feels professional
Analytics & reporting	Pricing and staffing decisions supported by live volume, revenue and demand data
Roles & permissions	Safe delegation — the team can grow without widening access to sensitive controls

SECTION 05

Platform Architecture Vision

The system is designed as a scalable, API-first platform. Every capability in the core is available through the API layer, which means new channels can be added later without rebuilding the business logic behind them.

What API-First Means for the Business

PRINCIPLE	COMMERCIAL CONSEQUENCE
Single core, many channels	A new channel — mobile app, partner site, bot — reuses existing logic instead of duplicating it, so it costs a fraction to add.
Clean integration surface	Third-party financial services and business systems can be connected without disruptive rework.
Scalable by design	Growth in customers and transaction volume is handled by scaling the platform, not by hiring more administrators.
Future-proof investment	The platform built today remains the foundation for the products the business launches next.

READY FOR INTEGRATION WITH

- ◆ Exchange websites and public rate pages
- ◆ External financial and banking services
- ◆ Mobile applications for customers and staff
- ◆ Third-party business and accounting systems
- ◆ Telegram bots for rates, requests and notifications
- ◆ Partner and affiliate distribution channels

Layer by Layer

LAYER	RESPONSIBILITY
Customer Portal	The customer-facing surface — registration, requests, tracking and history
CRM Core Platform	Business logic, data ownership and the workflow engine that drives every process
Pricing System	Currencies, price types and rules — the single source of truth for every published rate
Transactions System	Request lifecycle, approvals, status and audit history
CRM System	Customer profiles, segmentation, KYC status and relationship activity
API Layer	One secure, versioned entry point that every internal and external channel consumes
Channels	Website widgets, mobile apps, Telegram bots and external services

SECTION 06

Business Benefits

The platform is not a technology upgrade for its own sake. Each capability maps to a measurable change in how the exchange operates, competes and protects itself.

EFFICIENCY

Reduce manual operations

Rate publishing, banner production, data entry and status updates move from repetitive manual work to automated workflow — freeing staff for customer-facing work.

ACCURACY

Increase transaction accuracy

Structured request forms and automatic banking verification remove the two biggest sources of costly error: mistyped account data and misunderstood instructions.

EXPERIENCE

Improve customer experience

Customers submit requests, track progress and view their history at any hour, with automatic notifications at every status change — a modern standard of service.

MARKETING

Automate marketing processes

On-brand rate banners for Instagram, Telegram and the website are produced in-house in minutes, always reflecting current prices.

MARKET PRESENCE

Provide real-time exchange rates

Live rates published simultaneously to the portal, website widgets, social channels and the public API — one update, full market visibility.

CONTROL

Improve security and compliance

KYC workflow, verified banking data, role-based permissions and complete audit history give the business a defensible operational record.

Before and After

DAILY TASK	TODAY	WITH THE PLATFORM
Publishing a new rate	Edited in several places, posted manually to each channel	Updated once, distributed automatically everywhere
Producing a rate banner	Sent to a designer, returned hours later	Generated in-house from live prices in minutes

DAILY TASK	TODAY	WITH THE PLATFORM
Receiving a request	Free-text message, details often incomplete	Structured form with required fields validated on entry
Checking bank details	Read from an image and typed by hand	Detected and verified automatically before processing
Answering "what is my status?"	Staff interrupted to check and reply	Visible in the portal, pushed by automatic notification
Monthly reporting	Assembled manually from records and memory	Generated from live data on the dashboard

What to Watch After Launch

The benefits above are observable in ordinary operating data. These are the indicators worth tracking from the first month, using the platform's own dashboard:

- ◆ Average time from request submitted to request completed
- ◆ Share of requests submitted through the portal rather than by message
- ◆ Number of transactions delayed or reworked due to incorrect banking data
- ◆ Time spent per week producing rate content and banners
- ◆ Volume of inbound "what is my status?" enquiries
- ◆ Repeat transaction rate per customer segment

SECTION 07

Future Expansion

Because every capability sits behind a shared API layer, the platform's roadmap is additive. Each of the directions below extends the same core rather than replacing it.

DIRECTION	WHAT IT ADDS
Mobile applications	Native customer and staff apps for rates, requests, approvals and push notifications — built directly on the existing API.
AI customer assistant	An assistant that answers routine rate and status questions, guides customers through submitting a request, and escalates only what needs a human.
Advanced analytics	Deeper demand forecasting, customer value modelling, margin analysis and trend detection across currencies and segments.
Automated trading workflows	Rule-driven pricing and request handling — automatic rate adjustment against defined conditions and straight-through processing for low-risk transactions.
More financial integrations	Additional banking, payment and verification providers, plus accounting and settlement systems, connected through the same integration surface.

An investment that compounds

Each phase reuses the customer base, transaction history, rate engine and permission model already in place. The platform becomes more valuable with every module added — and every month of data it accumulates.

A Complete Digital Transformation for Exchange Businesses

The Exchange CRM Platform transforms traditional exchange operations into a modern digital ecosystem. It does this not by adding another isolated tool, but by connecting the parts of the business that have always been separate.

**Exchange Rates → Customer Management → Transaction Processing
→ Verification → Marketing → Reporting**

The result is a single solution that manages customers, automates workflows, improves security and delivers a professional digital experience — to staff and customers alike. Manual processes are reduced, operational accuracy rises, compliance becomes routine rather than exceptional, and management finally sees the business in real time.

One platform. Every operation. Built for how exchanges actually work.
